

本試題是否可以使用計算機:  可使用,  不可使用 (請命題老師勾選)

1. Consider the flow field given by stream function,  $\psi = ax^2 - ay^2$ , where  $a$  is constant.  
 (a) Show that the flow is irrotational. (10%)  
 (b) Determine the velocity potential for this flow. (10%)

2. A shaft of radius  $r_i$  is held concentrically in a cylindrical case of radius  $r_o$ . The shaft is kept stationary and the case is moved at a constant velocity  $V_o$  (see Fig. 1). There is no pressure gradient and the flow is laminar and incompressible.  
 (a) Determine the velocity distribution of this flow with viscosity  $\mu$  (10%)  
 (b) What force (per unit length) is needed to move the outer cylinder? (10%)

Fig. 1

3. A thin film of liquid falls down a vertical flat plate (see Fig. 2). The viscous shear force and the gravity force acting on the film are assumed in balance. This implies that the film flows steadily with a constant thickness  $\delta$ .  
 (a) Please simplify the following boundary layer equation for this situation. (10%)  

$$u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = -\frac{1}{\rho} \frac{\partial p}{\partial x} + g + \nu \frac{\partial^2 u}{\partial y^2}$$
  
 (b) Write the boundary conditions for the equation by neglecting the density and drag force from the surrounding air. (10%)  
 (c) Solve the velocity distribution in the film in terms of  $\delta$ . (10%)

Fig. 2

(背面仍有題目, 請繼續作答)

4. Consider two-dimensional laminar boundary-layer flow along a flat plate (see Fig. 3). Assume the velocity profile in the boundary layer is sinusoidal,

$$\frac{u}{U} = \sin\left(\frac{\pi y}{2\delta}\right)$$

Find expressions for:

- the rate of growth of  $\delta$  as a function of  $x$ . (10%)
- the displacement thickness,  $\delta^*$ , as a function of  $x$ . (10%)
- the total friction force on a plate of length  $L$  and width  $b$ . (10%)
