摘 要.....	i
Abstract.....	ii
誌謝.....	iii
1. Introduction.....	1
1.1 Functional structure of the vertebrate retina.....	1
1.2 ON-OFF direction selective ganglion cells in adult rabbit retina.....	2
1.3 Development of retinal ganglion cells in the rabbit retina.....	3
1.4 Effects of visual experience on the development of visual pathway.....	4
1.5 Goals and summary.....	5
2. Materials and Methods.....	7
2.1 Retina preparation.....	7
2.2 Light stimuli.....	8
2.3 Extracellular recording.....	10
2.4 Intracellular dye injection.....	10
2.5 Image acquisition.....	11
2.6 Data analysis.....	12
3. Results.....	14
3.1 The DSGCs can be found in both normal-reared and dark-reared rabbits around eye opening, but the strength of directional tuning is significantly higher in dark-reared rabbits after P22.....	14
3.2 Velocity tuning of the DSGCs is adult-like around eye opening, and is not affected by light deprivation.....	15
3.3 Classical center-surround organization of the DSGCs attains its adult form around eye opening, and is independent of rearing conditions.....	16
3.4 Light deprivation enhances surround inhibition induced by the preferred direction motion of the DSGCs.....	17
3.5 Motion surround inhibition of the DSGCs is apparent around eye opening, but the strength of inhibition is weaker in dark-reared rabbits after P22.....	18
3.6 Contextual tuning of the DSGCs is not mature until P22, and dark rearing has a profound effect on this property.....	19
3.7 Light deprivation has no observable effect on dendritic features and tracer coupling patterns of the DSGCs.....	20

4. Discussions	22
4.1 Strength of spatially offset inhibition responsible for generating direction selectivity is developmentally modulated.....	22
4.2 Complex receptive field properties of the immature DSGCs is correlated with stronger asymmetric synaptic inputs.....	23
4.3 Light deprivation alters the maturation of suppressive pathway in the DSGCs.....	25
5. References.....	28
6. Figures.....	31
