7.7 Sorting with Several Keys

A list of records is said to be sorted with respect to the keys  $K^1, K^2, ..., K^r$  iff for every pair of records i and j, i < j and  $(K_i^1, K_i^2, ..., K_i^r) \leq (K_j^1, K_j^2, ..., K_j^r)$ 

 $\begin{aligned} &(x_1,\ldots,x_r) \leq (y_1,\ldots,y_r)\\ \text{iff either } x_k = y_k, 1 \leq k \leq n, \text{and}\\ &x_{n+1} < y_{n+1} \text{ for some } n < r,\\ &\text{or } x_k = y_k, 1 \leq k \leq r \end{aligned}$ 

Sorting a Deck of Cards

- Each card has two keys
  - ∘  $K^1$  (Suits): ♠ < ♦ < ♥ < ♠
  - $K^2$  (Face values): 2 < 3 < 4 ... < J < Q < K < A
  - $^{\circ}$  The sorted list is: 2  $\spadesuit$ , ...,  $A \spadesuit$ , ...,  $2 \spadesuit$ , ...,  $A \spadesuit$
- Most-significant-digit (MSD) sort
  - $^{\circ}$  Sort using  $K^1$  to obtain 4 "piles" of records.
  - Sort each piles into sub-piles.
  - Merge piles by placing the piles on top of each other.

# Sorting a Deck of Cards (cont'd)

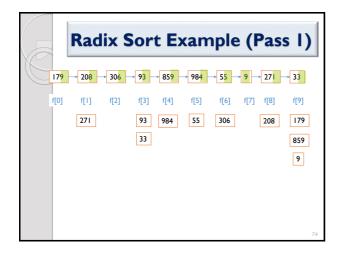

- Least-significant-digit (LSD) sort
  - $\circ$  Sort using  $K^2$  to obtain 13 "piles" of records.
  - Place 3's on top of 2's,..., Aces on top of kings.
     2 < 3 < 4 ... J < Q < K < A</li>
  - Using a stable sort with respect to  $K^1$  and obtain 4 "piles".
  - Merge piles by placing the piles on top of each other.

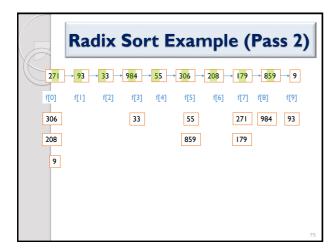

# **Bin Sort (Bucket Sort)**

- Assume the records in a list to be sorted come from a set of size m, say  $\{1,2,...,m\}$ .
- Create *m* buckets.
- Scan the sequence  $a[1] \dots a[n]$ , and put a[i] element into the  $a[i]^{th}$  bucket.
- Concatenate all buckets to get the sorted list.
- Suitable for a set with small m.

## Radix Sort

- Decompose the key (number) into subkeys using some radix r
  - For r = 10, K = 123, then  $K^1 = 1$ ,  $K^2 = 2$ , and  $K^3 = 3$ .
- Create r buckets (0 ~ r-1).
- Apply bin sort with MSD or LSD order.
- Suitable to sort numbers with large value range.

```
Radix Sort Example (Pass 3)

306 208 9 33 55 859 271 79 93 984

1(0) 1(1) 1(2) 1(3) 1(4) 1(5) 1(6) 1(7) 1(8) 1(9)
9 179 208 306 859 984

33 271

55
93

Time Complexity: O(d*(n+r))
```

# LSB Radix Sort (code) 1/2 template <class T> int RadixSort(T \*a, int \*link, const int d, const int r, const int n) {// using a radix sort with d digits `radix r to sort a[1:n] // digit(a[i], j, r) return the j-th key in radix r of a[i] // each digit is within the range [0, r). Using the bin sort to // sort elements of the same digit. int e[r], f[r], // head and tail of the bin int first = 1; // start from the 1st element for(int i =1; i < n; i++) link[i]=i+1; // link the elements link[n] = 0; // do radix sorting.

# LSB Radix Sort (code) 2/2

```
// do radix sorting...
for (i = d-1; i >=0; i--) { // sort in LSB order
fill(f, f+r, 0); // initialize the bins
for (int current = first; current; current = link[current])
{ // put the element with key k to bin[k]
    int k = digit(a[current], i, r);
    if (f[k]= 0) f[k] = current;
    else link[e[k]] = current;
    else link[e[k]] = current;
}
for (j = 0; !f[j]; j++); // find the 1<sup>st</sup> non-empty bin
first = f [j];
    int last = e[j];
    for (int k = j + 1; k < r; k++) { // link the rest of bins
        if (f[k]) {
            link[last] = f[k];
            last = e[k];
        }
        link[last] = 0;
    }
    return first;
}
</pre>
```
