九十七學年第二學期 PHYS2320 電磁學 期末考試題(共二頁) [Griffiths, Chaps. 9, 10, and 12] 2009/06/09, 10:10am-12:00am, 教師: 張存續

記得寫上學號,班別及姓名。請依題號順序每頁答一題。

- 1. (10%, 10%)
 - (a) **Einstein's velocity addition rule.** The transformations between two inertial systems S and \overline{S} are $\overline{x} = \gamma(x vt)$ and $\overline{t} = \gamma(t vx/c^2)$. v is the relative speed of the system \overline{S} with respect to the system S. Find the relation between the two velocities $(\overline{u} = d\overline{x}/d\overline{t})$ and u = dx/dt.
 - (b) Two lumps of clay, each of (rest) mass m, collide head-on each at 4/5c. They stick together. Find the mass (M) of the composite lump? Why the total mass was not conserved?

- 2. (10%, 10%)
 - (a) Show that $(\mathbf{E} \cdot \mathbf{B})$ is relativistically invariant.
 - (b) Suppose that in one inertia system $\mathbf{B} = 0$ but $\mathbf{E} \neq 0$ (at some point P). Is it possible to find another system in which the electric field is zero at P.

$$\overline{E}_x = E_x$$
, $\overline{E}_y = \gamma (E_y - vB_z)$, $\overline{E}_z = \gamma (E_z + vB_y)$

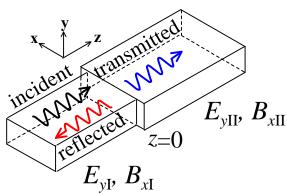

$$\overline{B}_x = B_x$$
, $\overline{B}_y = \gamma (B_y + \frac{v}{c^2} E_z)$, $\overline{B}_z = \gamma (B_z - \frac{v}{c^2} E_y)$

- 3. (8%, 12%)
 - (a) Write down the Retarded scalar and vector potentials (4%)
 - (b) Show that the retarded scalar potential satisfies the inhomogeneous wave equation.

- 4. (10%, 10%) Consider a coaxial cable, of length *d*, consisting of an inner conductor (radius *a*) and an outer conductor (radius *b*).
 - (a) If the electric field is $\mathbf{E}(s,\phi,z,t) = \frac{A\cos(kz-\omega t)}{s}\hat{\mathbf{s}}$, find the magnetic field and the Poynting vector (i.e. the energy flux).
 - (b) Consider the resonant cavity produced by closing the two ends of the coaxial waveguide. Find the lowest resonant frequency for TEM mode and calculate the Poynting vector.

- 5. (10%, 10%) Consider a TE_{10} wave propagates along the z-axis. The incident wave hits an E-plane discontinuity at z=0 as shown in the figure below.
 - (a) Write down the electric and magnetic fields in region I and II, respectively.
 - (b) Calculate the reflection coefficient (T = transmitted power/incident power)

[Hint: Incident wave $\tilde{\mathbf{E}}_{I}(z,t) = \tilde{E}_{0I}e^{i(k_{1}z-\omega t)}\hat{\mathbf{y}}$, $\tilde{\mathbf{B}}_{I}(z,t) = -\frac{1}{v_{1}}\tilde{E}_{0I}e^{i(k_{1}z-\omega t)}\hat{\mathbf{x}} + (\text{can be omitted})\hat{\mathbf{z}}$].

1.

(a)
$$\overline{x} = \gamma(x - vt) \Rightarrow d\overline{x} = \gamma(dx - vdt),$$

 $\overline{t} = \gamma(t - vx/c^2) \Rightarrow d\overline{t} = \gamma(dt - vdx/c^2)$

$$\frac{d\overline{x}}{d\overline{t}} = \overline{u} = \frac{\gamma(dx - vdt)}{\gamma(dt - vdx/c^2)} = \frac{(u - v)}{(1 - vu/c^2)} \text{ where } \frac{dx}{dt} = u \Rightarrow u = \frac{\overline{u} + v}{1 + \overline{u}v/c^2}$$

(b) Example 12.7

before:
$$E = \frac{2mc^2}{\sqrt{1 - u^2/c^2}}$$
 relativistic energy, $u = \frac{4}{5}c$

after:
$$E = Mc^2 = \frac{10mc^2}{3}$$
 :: $M = \frac{10m}{3} > 2m$

Kinetic energy is converted into rest energy, so the total mass increases.

2. HW 12.46

(a)

$$\overline{E}_x = E_x$$
, $\overline{E}_y = \gamma (E_y - vB_z)$, $\overline{E}_z = \gamma (E_z + vB_y)$

$$\overline{B}_x = B_x$$
, $\overline{B}_y = \gamma (B_y + \frac{v}{c^2} E_z)$, $\overline{B}_z = \gamma (B_z - \frac{v}{c^2} E_y)$

$$\begin{split} \overline{\mathbf{E}} \cdot \overline{\mathbf{B}} &= E_x B_x + \gamma (E_y - v B_z) \gamma (B_y + \frac{v}{c^2} E_z) + \gamma (E_z + v B_y) \gamma (B_z - \frac{v}{c^2} E_y) \\ &= E_x B_x + \gamma^2 (E_y B_y - \frac{v^2}{c^2} B_z E_z + \frac{v}{c^2} E_y E_z - v B_y B_z + E_z B_z - \frac{v^2}{c^2} E_y B_y + v B_y B_z - \frac{v}{c^2} E_y E_z) \\ &= E_x B_x + \gamma^2 (1 - \frac{v}{c^2}) (E_y B_y + E_z B_z) \\ &= \mathbf{E} \cdot \mathbf{B} \end{split}$$

So it is relativistically invariant

(b) $\mathbf{B} = 0$ but $\mathbf{E} \neq 0$

$$\overline{E}_x = E_x$$
, $\overline{E}_y = \gamma(E_y)$, $\overline{E}_z = \gamma(E_z)$

$$\overline{B}_x = 0$$
, $\overline{B}_y = \gamma(\frac{v}{c^2}E_z)$, $\overline{B}_z = \gamma(\frac{v}{c^2}E_y)$

It is impossible to find another system in which the electric field is zero at P

3. Griffith page 424-425, lecture note Chap. 10 pp.14-16

(a)

Retarded potentials:
$$\begin{cases} \text{scalar} \quad V(\mathbf{r},t) = \frac{1}{4\pi\varepsilon_0} \int \frac{\rho(\mathbf{r}',t_r)}{2} d\tau' \\ \text{vector} \quad \mathbf{A}(\mathbf{r},t) = \frac{\mu_0}{4\pi} \int \frac{\mathbf{J}(\mathbf{r}',t_r)}{2} d\tau' \end{cases} \quad t_r \equiv t - \frac{2}{c} \text{ (called the retarded time)}$$

(b)
$$\nabla V = \frac{1}{4\pi\varepsilon_0} \int \nabla \left(\frac{\rho(\mathbf{r}', t_r)}{\tau} \right) d\tau' = \frac{1}{4\pi\varepsilon_0} \int \frac{\tau(\nabla \rho) - \rho(\nabla \tau)}{\tau^2} d\tau'$$

Using quotient rule:
$$\nabla \left(\frac{f}{g} \right) = \frac{g \nabla f - f \nabla g}{g^2}$$

$$\nabla \rho = \nabla \rho(\mathbf{r}', t_r) = \frac{\partial \rho}{\partial t_r} \nabla t_r = \dot{\rho} \frac{-1}{c} \nabla z, \quad \nabla z = \hat{z}$$

$$\nabla V = \frac{-1}{4\pi\varepsilon_0} \int \left[\frac{\dot{\rho}\hat{\nu}}{c_v} + \frac{\rho\hat{\nu}}{v^2}\right] d\tau'$$

$$\nabla \cdot \nabla V = \nabla^2 V = \frac{-1}{4\pi\varepsilon_0} \int \nabla \cdot \left[\frac{\dot{\rho}\hat{\tau}}{c_{\gamma}} + \frac{\rho\hat{\tau}}{\sqrt{2}} \right] d\tau'$$

$$\nabla \cdot \left[\frac{\dot{\rho} \hat{\lambda}}{c_{\gamma}} + \frac{\rho \hat{\lambda}}{\gamma^{2}} \right] = \frac{1}{c} \nabla \cdot (\dot{\rho} \frac{\hat{\lambda}}{\gamma}) + \nabla \cdot (\rho \frac{\hat{\lambda}}{\gamma^{2}})$$

$$= \frac{1}{c} \left[\frac{\hat{\lambda}}{\gamma} \cdot \nabla \dot{\rho} + \dot{\rho} \nabla \cdot \frac{\hat{\lambda}}{\gamma} \right] + \left[\frac{\hat{\lambda}}{\gamma^{2}} \cdot \nabla \rho + \rho \nabla \cdot \frac{\hat{\lambda}}{\gamma^{2}} \right]$$

$$\nabla \dot{\rho} = \nabla \dot{\rho}(\mathbf{r}', t_r) = \frac{\partial \dot{\rho}}{\partial t_r} \nabla t_r = \ddot{\rho} \frac{-1}{c} \nabla z = -\frac{\ddot{\rho}}{c} \hat{z} \quad \text{and} \quad \nabla \rho = \frac{-\dot{\rho}}{c} \hat{z}$$

$$\nabla \cdot \frac{\hat{\lambda}}{\gamma} = \frac{1}{\gamma^2}$$
 and $\nabla \cdot \frac{\hat{\lambda}}{\gamma^2} = 4\pi \delta^3(\gamma)$

$$\nabla \cdot \left[\frac{\dot{\rho}\hat{\lambda}}{c_{\gamma}} + \frac{\rho\hat{\lambda}}{\gamma^{2}}\right] = \frac{1}{c} \left[-\frac{\ddot{\rho}}{c_{\gamma}} + \frac{\dot{\rho}}{\gamma^{2}}\right] + \left[-\frac{1}{\gamma^{2}} \frac{\dot{\rho}}{c} + 4\pi\rho\delta^{3}(\gamma)\right]$$
$$= -\frac{1}{c^{2}} \ddot{\rho} + 4\pi\rho\delta^{3}(\gamma)$$

$$\nabla^2 V = \frac{-1}{4\pi\varepsilon_0} \int [-\frac{1}{c^2} \ddot{\rho} + 4\pi\rho \delta^3(\gamma)] d\tau' = \frac{1}{c^2} \int \frac{\ddot{\rho}}{4\pi\varepsilon_0} d\tau' - \frac{\rho(\mathbf{r},t)}{\varepsilon_0}$$

$$\int \frac{\ddot{\rho}}{4\pi\varepsilon_0} d\tau' = \int \frac{1}{4\pi\varepsilon_0} \frac{\partial^2 \rho}{\partial t_r^2} d\tau' = \frac{\partial^2}{\partial t_r^2} \int \frac{\rho}{4\pi\varepsilon_0} d\tau' = \frac{\partial^2 V}{\partial t_r^2} = \frac{\partial^2 V}{\partial t_r^2}$$

$$\nabla^2 V = \frac{1}{c^2} \frac{\partial^2 V}{\partial t^2} - \frac{\rho(\mathbf{r}, t)}{\varepsilon_0} \quad \Rightarrow \quad \nabla^2 V - \frac{1}{c^2} \frac{\partial^2 V}{\partial t^2} = -\frac{\rho(\mathbf{r}, t)}{\varepsilon_0}$$

4. HW 9.38

(a)

$$\mathbf{E}(s,\phi,z,t) = \frac{A\cos(kz - \omega t)}{s} \hat{\mathbf{s}} \implies \mathbf{B}(s,\phi,z,t) = \frac{A\cos(kz - \omega t)}{cs} \hat{\mathbf{\phi}}$$

$$\mathbf{S} = \frac{1}{\mu_0} (\mathbf{E} \times \mathbf{B}) = \frac{A^2 \cos^2(kz - \omega t)}{\mu_0 c s^2} \hat{\mathbf{s}} \times \hat{\mathbf{\phi}} = \frac{A^2 \cos^2(kz - \omega t)}{\mu_0 c s^2} \hat{\mathbf{z}}$$

$$\mathbf{E}(s,\phi,z=0 \text{ and } d,t) = \frac{A\sin(kz)}{s}\sin(\omega t)\hat{\mathbf{s}}, k = \frac{\pi}{d}$$

(b) new boundary conditions

$$\mathbf{B}(s,\phi,z,t) = \frac{A\cos(kz)}{cs}\cos(\omega t)\hat{\mathbf{\varphi}}$$

$$k = \frac{\pi}{d}, \lambda = 2d \implies f = \frac{c}{2d}$$

$$\mathbf{S} = \frac{1}{\mu_0} (\mathbf{E} \times \mathbf{B}) = \frac{A^2 \cos(kz) \sin(kz)}{\mu_0 cs^2} \cos(\omega t) \sin(\omega t) \hat{\mathbf{z}}$$

5. (a)

Incident wave:
$$\tilde{\mathbf{E}}_{I}(z,t) = \tilde{E}_{0I}e^{i(k_{1}z-\omega t)}\hat{\mathbf{y}}, \quad \tilde{\mathbf{B}}_{I}(z,t) = -\frac{1}{v_{1}}\tilde{E}_{0I}e^{i(k_{1}z-\omega t)}\hat{\mathbf{x}}$$

Reflected wave:
$$\tilde{\mathbf{E}}_{R}(z,t) = \tilde{E}_{0R}e^{i(-k_1z-\omega t)}\hat{\mathbf{y}}, \quad \tilde{\mathbf{B}}_{R}(z,t) = \frac{1}{v_1}\tilde{E}_{0R}e^{i(-k_1z-\omega t)}\hat{\mathbf{x}}$$

Transmitted wave:
$$\tilde{\mathbf{E}}(z,t) = \tilde{E}_{0T}e^{i(k_2z-\omega t)}\hat{\mathbf{y}}, \quad \tilde{\mathbf{B}}(z,t) = -\frac{1}{v_2}\tilde{E}_{0T}e^{i(k_2z-\omega t)}\hat{\mathbf{x}}$$

(b) Boundary conditions:
$$\mathbf{E}_{1}^{"} - \mathbf{E}_{2}^{"} = 0$$
 and $\frac{1}{\mu_{1}} \mathbf{B}_{1}^{"} - \frac{1}{\mu_{2}} \mathbf{B}_{2}^{"} = 0$

$$\tilde{E}_{0I} + \tilde{E}_{0R} = \tilde{E}_{0T}$$
 and $\frac{1}{\mu_1 v_1} (\tilde{E}_{0I} - \tilde{E}_{0R}) - \frac{\tilde{k}_2}{\mu_2 \omega} \tilde{E}_{0T} = 0$

$$\begin{split} \tilde{E}_{0R} &= (\frac{1-\beta}{1+\beta})\tilde{E}_{0I} \\ \tilde{E}_{0T} &= (\frac{2}{1+\beta})\tilde{E}_{0I} \end{split} \quad \text{where} \quad \beta \equiv \frac{\mu_1 v_1}{\mu_2 \omega} \tilde{k}_2 \end{split}$$

$$I_{I} \equiv \left\langle \mathbf{S} \cdot \hat{\mathbf{z}} \right\rangle = \frac{1}{2} v_{1} \varepsilon_{1} E_{0I}^{2} \cos \theta_{I}, \quad I_{T} = \frac{1}{2} v_{2} \varepsilon_{2} E_{0T}^{2} \cos \theta_{T} = \beta \left(\frac{2}{1+\beta}\right)^{2} I_{I}$$

$$T \equiv \frac{I_T}{I_I} = \beta (\frac{2}{1+\beta})^2$$
